1 Tengwar Formal Unicode/AAT: Graphite and AAT options

Here are samples of the different options. The options are specified by adding something to the font name in the `\font` command. The extended font names are all given in this document. A font specification will look like this:

```
\font\bla="font(/GR):feature=value(;feature=value)"
```

In this specification, the part `bla` is a string of your choice. On Mac OS X, the part `/GR` is optional. It tells XeTeX to use the Graphite information. If you leave it away, it will use the AAT information, which only works on Mac OS X. Note that you can define as many features as you like:

```
  \font\myformal="Tengwar Formal Unicode/GR:204=1;207=2"
at 15pt
```

After this `\font` command has been defined, you can use `\myformal` as a command, for instance as follows:

```
  \myformal ʌcɛo ɔonʗp \normalfont
```

This will look like this: ʌcɛo ɔonʗp
